## QUESTION

(a) Define the terms homomorphism and isomorphism.
(b) In each of the following cases decides whether or not the given pair of groups are isomorphic. If they are give an explicit isomorphism between them, and if they are not give brief reasons how you can be sure of this.
(i) $Z_{3} \times Z_{5}$ and $Z_{15}$.
(ii) $Z_{3} \times Z_{6}$ and $Z_{18}$.
(iii) $D_{5}$ and $Z_{10}$.
(c) For each positive integer $n$ less than or equal to 8 give a list of groups of order $n$ so that no two groups in your list are isomorphic, but every group of order $n$ is isomorphic to one of the groups on your list. For each order where there is more than one isomorphism class of group of that order, indicate how you distinguish between the different isomorphism classes.
(d) Decide which of the groups in your list from part (iii) is isomorphic to the group given by the following Cayley table, giving brief reasons for your answer:

| . | $e$ | $g$ | $c$ | $b$ | $h$ | $d$ | $f$ | $k$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $e$ | $e$ | $g$ | $c$ | $b$ | $h$ | $d$ | $f$ | $k$ |
| $g$ | $g$ | $c$ | $b$ | $e$ | $k$ | $h$ | $d$ | $f$ |
| $c$ | $c$ | $b$ | $e$ | $g$ | $f$ | $k$ | $h$ | $d$ |
| $b$ | $b$ | $e$ | $g$ | $c$ | $d$ | $f$ | $k$ | $h$ |
| $h$ | $h$ | $d$ | $f$ | $k$ | $c$ | $b$ | $e$ | $g$ |
| $d$ | $d$ | $f$ | $k$ | $h$ | $g$ | $c$ | $b$ | $e$ |
| $f$ | $f$ | $k$ | $h$ | $d$ | $e$ | $g$ | $c$ | $b$ |
| $k$ | $k$ | $h$ | $d$ | $f$ | $b$ | $e$ | $g$ | $c$ |

## ANSWER

(a) Given groups $\left(G, e_{G}, *\right)$ and $\left(H, e_{H},.\right)$ a homomorphism is a function $\phi: G \Longrightarrow H$ such that for every $g, k \in G, \phi(g * h)=\phi(g), \phi(h)$. An isomorphism is a bijective homomorphism.
(b) (i) The function $Z_{3} \times Z_{3} \Longrightarrow Z_{15}$ defined by $(1,1) \mapsto 1$ is an isomorphism since $\operatorname{hcf}(3,5)=1$.
(ii) $Z_{3} \times z_{6}$ is not isomorphic to $Z_{18}$ since every element of $Z_{3} \times Z_{6}$ has order dividing $\operatorname{lcm}(3,6)=6$.
(iii) $D_{5}$ is not abelian so it cannot be isomorphic to $Z_{10}$.
(c)

| Group | order | distinguishing features |
| :---: | :---: | :--- |
| $\{e\}$ | 1 |  |
| $Z_{2}$ | 2 |  |
| $Z_{3}$ | 3 |  |
| $Z_{4}$ | 4 | contains an element of order 4, |
|  |  | and two elements of order 2 |
| $z_{2} \times Z_{2}$ | 2 | 3 elements of order 2 |
| $Z)_{5}$ | 5 |  |
| $Z_{6}$ | 6 | abelian |
| $D_{3}$ | 6 | non-abelian |
| $Z_{7}$ | 7 |  |
| $Z_{8}$ | 8 | abelian with one element of order 2 |
| $Z_{4} \times Z_{2}$ | 8 | abelian with three elements of order 2 |
| $Z_{2} \times Z_{2} \times Z_{2}$ | 8 | abelian with seven elements of order 2 |
| $D_{4}$ | 8 | non-abelian with five elements of order 2 |
| $\mathcal{Q}$ | 8 | non-abelian with one element of order 2 |

(d) $h g=d \neq k=g h$ so the group is non-abelian. It has one element of order 2 so it is isomorphic to $\mathcal{Q}$.
