## MA181 INTRODUCTION TO STATISTICAL MODELLING GOODNESS-OF-FIT TEST

Example - Mendel's peas Mendel's double intercross data for (Round,Yellow)× (Wrinkled, Green) peas. The expected frequencies are in the ratios 9:3:3:1 on the assumption that the factors segregate independently.

|  | $R Y$ | $W Y$ | $R G$ | $W G$ | Total |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Observed frequency | 315 | 101 | 108 | 32 | 556 |
| Expected frequency | $312 \frac{3}{4}$ | $104 \frac{1}{4}$ | $104 \frac{1}{4}$ | $34 \frac{3}{4}$ | 556 |

$$
x^{2}=\frac{\left(2 \frac{1}{4}\right)^{2}}{312 \frac{3}{4}}+\frac{\left(3 \frac{1}{4}\right)^{2}}{104 \frac{1}{4}}+\frac{\left(3 \frac{1}{4}\right)^{2}}{104 \frac{1}{4}}+\frac{\left(2 \frac{3}{4}\right)^{2}}{34 \frac{3}{4}}=0.470
$$

Critical regions with $\nu=3$ are $x^{2}>7.815$ for $\alpha=0.05$ and $x^{2}>$ 11.34 for $\alpha=0.01$. Therefore accept $H_{0}$ : the two genes segregate independently.

Example - Pharbitis Double intercross data for two genes $A$ and $B$ in Pharbitis. The expected frequencies are again in the ratios 9:3:3:1, on the assumption that $A$ and $B$ segregate independently.

|  | $A B$ | $A b$ | $a B$ | $a b$ | Total |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Observed frequency | 187 | 35 | 37 | 31 | 290 |
| Expected frequency | $163 \frac{3}{8}$ | $54 \frac{3}{8}$ | $54 \frac{3}{8}$ | $18 \frac{1}{8}$ | 290 |
| $x^{2}=\frac{\left(23 \frac{7}{8}\right)^{2}}{163 \frac{1}{8}}+\frac{\left(19 \frac{3}{8}\right)^{2}}{54 \frac{3}{8}}+\frac{\left(17 \frac{3}{8}\right)^{2}}{54 \frac{3}{8}}+\frac{\left(12 \frac{7}{8}\right)^{2}}{18 \frac{1}{8}}=25.096$ |  |  |  |  |  |

Critical regions with $\nu=3$
$x^{2}>7.815$ for $\alpha=0.05$
$x^{2}>11.34$ for $\alpha=0.01$
$x^{2}>16.27$ for $\alpha=0.001$
Reject $H_{0}$ and conclude (very strongly) that the genes are linked.

## Estimating parameters

Example - Pharbitis revisited One theory suggests that the probabilities for the four cells can be written as $(2+\theta) / 4,(1-\theta) / 4,(1-\theta) / 4$ and $\theta / 4$ for some parameter $\theta$. The maximum likelihood estimate of $\theta$ is $\hat{\theta}=0.4835$, which leads to the expected frequencies given in the following.

|  | $A B$ | $A b$ | $a B$ | $a b$ | Total |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Observed Frequency | 187 | 35 | 37 | 31 | 290 |
| Expected frequency | 180.054 | 37.446 | 37.446 | 35.054 | 290 |

$$
x^{2}=\frac{(187-180.054)^{2}}{180.054}+\ldots+\frac{(31-35.054)^{2}}{35.054}=0.902
$$

Critical regions with 2 degrees of freedom are
$x^{2}>5.991$ for $\alpha=0.05$
$x^{2}>9 / 210$ for $\alpha=0.01$
Accept $H_{0}$ : model given as above.
Example Peas in pods The table below gives, in its second column, the frequency distribution of the number $Y$ of peas found in the pod of a four-seeded line of pea. A total of 269 pods were inspected.
$\hat{\pi}=0.5530$

| Number of peas in pod | 0 | 1 | 2 | 3 | 4 | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Observed frequency | 16 | 45 | 100 | 82 | 26 | 269 |
| Expected frequency | 10.74 | 53.15 | 98.62 | 81.33 | 25.15 | 268.99 |

$$
x^{2}=\frac{(16-10.74)^{2}}{10.74}+\ldots+\frac{(26-25.15)^{2}}{25.15}=3.88
$$

Critical regions with three degrees of freedom as on page 1. Do not reject $H_{0}$ : model given by binomial distribution.

Small expected frequencies No expected frequency should be smaller than one and no more than $20 \%$ should be less than five. Otherwise it is necessary to pool cells.

Example - Poisson distribution The number $Y$, of $\alpha$-particles emitted by a film of Polonium in 2608 intervals of $\frac{1}{8}$ minute was given on the Poisson distribution handout. The end of the table is as follows:

| Frequency of Intervals <br> Observed |  |  |
| :---: | :---: | :---: |
| 10 | 10 | Poisson, $E_{y}$ |
| 11 | 4 | 11.3 |
| 12 | 0 | 4.0 |
| 13 | 1 | 1.3 |
| 14 | 1 | 0.4 |
| $\geq 15$ | 0 | 0.1 |

The last four cells may be pooled to give the following complete table.
$\hat{\mu}=3.8715$

| $y$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $O_{y}$ | 57 | 203 | 383 | 525 | 532 | 408 | 273 | 139 | 45 | 27 |

| $E_{y}$ | 54.3 | 210.3 | 407.1 | 525.3 | 508.4 | 393.7 | 254.0 | 140.5 | 68.0 | 29.2 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| 10 | 11 | $\geq 12$ | Total |
| :---: | :---: | :---: | :---: |
| 10 | 4 | 2 | 2608 |

| 11.3 | 4.0 | 1.8 | 2607.9 |
| :--- | :--- | :--- | :--- |

$x^{2}=13.0$
Critical regions with 11 degrees of freedom
$x^{2}>19.68$ for $\alpha=0.05$
$x^{2}>24.72$ for $\alpha=0.01$
$x^{2}>31.26$ for $\alpha=0.001$
Accept $H_{0}$ : model is given by Poisson distribution.
